Reflection Questions:

1) Did your estimations reflect the actual effort?

   Yes, the estimations reasonably reflected the relative effort required for the user stories. The stories were assigned Fibonacci-based story points according to their complexity and uncertainty. Smaller stories such as “View Active Subscriptions” were estimated at 3 points, while more complex functionality such as “Generate Expense Report” was estimated at 8 points. All planned stories were completed during Sprint 1, indicating that the estimates were reasonably suitable for the simulated sprint.

2) Was your backlog well-prioritized?

   Yes, the backlog was prioritized according to the importance and user impact of the requirements identified in Lab 1. Core subscription and expense-management features such as adding subscriptions, viewing subscriptions, and calculating recurring expenses were given High priority. Renewal reminders and expense reporting were given Medium priority. This helped organize the work according to the importance of each requirement.

3) How did your simulated sprint align with your plan?

   The simulated Sprint 1 aligned well with the planned backlog. All five selected user stories, totaling 26 story points, were included in the sprint. The stories were progressed through the workflow from To Do to In Progress and finally to Done. By the end of the sprint, all planned stories were completed, showing that the sprint plan was successfully executed.

4) What insights did the burndown chart give about your team’s capacity?

   The burndown chart showed how the remaining work decreased from the initial 26 story points to 0 by the completion of the sprint. This indicated that the planned workload could be completed within the sprint period. The chart also provided an overview of the team's progress against the expected guideline and demonstrated that the team was able to complete the committed work within the planned sprint.
